

COMPUTERISED MAINTENANCE MANAGEMENT SOLUTION - CMMS

Planned preventative plant and fleet management and maintenance.

Fleet and Asset maintenance and repair management systems incorporate short-, medium-, and long-term activities and tasks within a process determined by the fleet operating environment and the fleet management plan. The required practices, processes and activities are designed to optimise fleet performance and cost in a specific operating environment.

Features & Benefits

Monitoring & Improvement

All processes must be individually and collectively measured for consistency and effectiveness as the production environment changes and the fleet ages for possible continuous improvement initiatives.

Resource & Labour Management

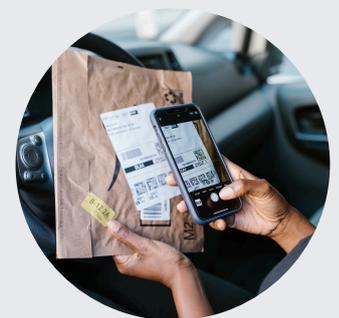

Track available employees and equipment certifications. Assign specific tasks and assemble crews. Organise shifts and manage pay rates.

Asset Register

Store, access and share asset information such as:

- Manufacturer, model, serial number and equipment class and type
- Associated costs and codes
- Location, position and performance and downtime statistics
- Associated documentation, video, and images such as repair manuals, safety procedures and warranties
- Availability of meters, sensors, and Internet of Things (IoT) instrumentation

Reporting, Analysis, & Auditing

Generate reports across maintenance categories such as asset availability, materials usage, labour and material costs, supplier assessments and more. Analyse information to understand asset availability, performance trends, MRO inventory optimisation and other information to support business decisions and gather and organise information for audits.

WORK ORDER MANAGEMENT

WORK ORDER MANAGEMENT ALSO INCLUDES CAPABILITIES TO:

- Automate work order generation
- Reserve materials and equipment
- Schedule and assign employees, crews, and shifts
- Review status and track downtime
- Record planned and actual costs
- Attach associated documentation, repair, and safety media

PREVENTIVE MAINTENANCE:

- Automate work order initiation based on time, usage, or triggered events.
